Algorithmic paradigms

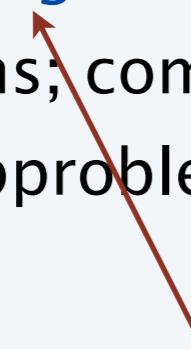

Greed. Process the input in some order, myopically making irrevocable decisions.

Divide-and-conquer. Break up a problem into **independent** subproblems; solve each subproblem; combine solutions to subproblems to form solution to original problem.

[Assignment](#) [Project](#) [Exam](#) [Help](#)

Dynamic programming. Break up a problem into a series of **overlapping** subproblems; combine solutions to small subproblems to form solution to large subproblem.

fancy name for
caching intermediate results
in a table for later reuse

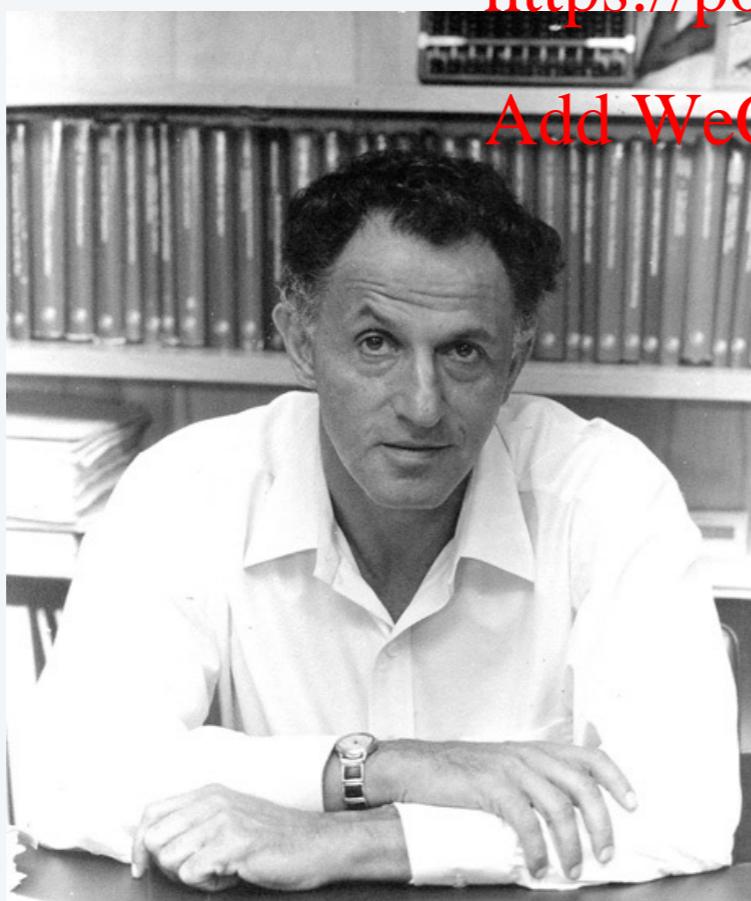

Dynamic programming history

Bellman. Pioneered the systematic study of dynamic programming in 1950s.

Etyymology.

- Dynamic programming = planning over time.
- Secretary of Defense had pathological fear of mathematical research.
- Bellman sought a “dynamic” adjective to avoid conflict.

THE THEORY OF DYNAMIC PROGRAMMING

RICHARD BELLMAN

1. Introduction. Before turning to a discussion of some representative problems which will permit us to exhibit various mathematical features of the theory, let us present a brief survey of the fundamental concepts, hopes, and aspirations of dynamic programming.

To begin with, the theory was created to treat the mathematical problems arising from the study of various multi-stage decision processes, which may roughly be described in the following way: We have a physical system whose state at any time t is determined by a set of quantities which we call state parameters, or state variables. At certain times, which may be prescribed in advance, or which may be determined by the process itself, we are called upon to make decisions which will affect the state of the system. These decisions are equivalent to transformations of the state variables, the choice of a decision being identical with the choice of a transformation. The outcome of the preceding decisions is to be used to guide the choice of future ones, with the purpose of the whole process that of maximizing some function of the parameters describing the final state.

Examples of processes fitting this loose description are furnished by virtually every phase of modern life, from the planning of industrial production lines to the scheduling of patients at a medical clinic; from the determination of long-term investment programs for universities to the determination of a replacement policy for machinery in factories; from the programming of training policies for skilled and unskilled labor to the choice of optimal purchasing and inventory policies for department stores and military establishments.

Dynamic programming applications

Application areas.

- Computer science: AI, compilers, systems, graphics, theory,
- Operations research.
- Information theory.
- Control theory.
- Bioinformatics.

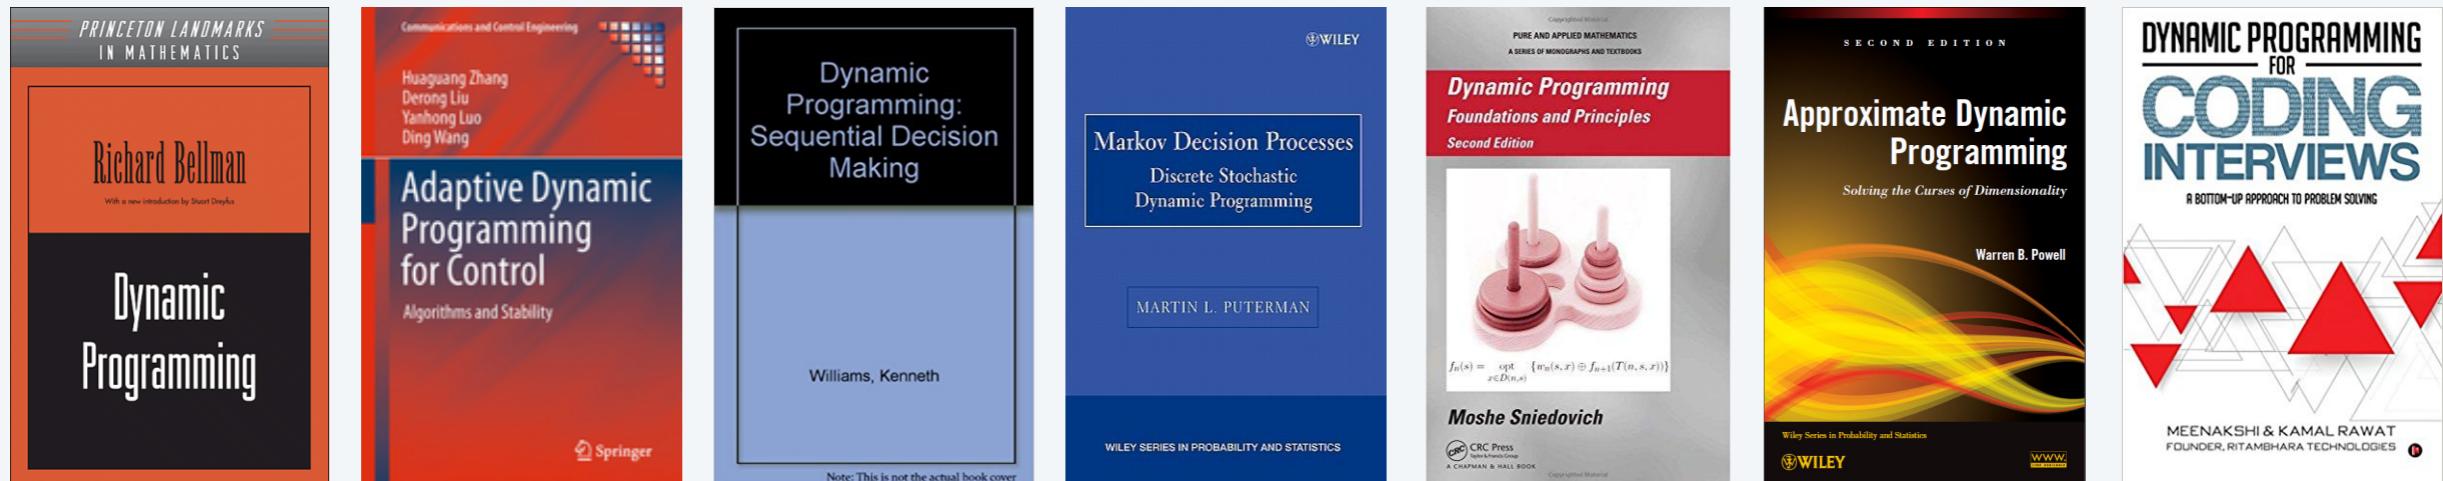

Assignment Project Exam Help

Some famous dynamic programming algorithms.

<https://powcoder.com>

- Avidan–Shamir for seam carving.
- Unix diff for comparing two files.
- Viterbi for hidden Markov models.
- De Boor for evaluating spline curves.
- Bellman–Ford–Moore for shortest path.
- Knuth–Plass for word wrapping text in *T_EX*.
- Cocke–Kasami–Younger for parsing context-free grammars.
- Needleman–Wunsch/Smith–Waterman for sequence alignment.

6. DYNAMIC PROGRAMMING I

- ▶ *weighted interval scheduling*
- ▶ *segmented least squares*

Assignment Project Exam Help

▶ Knapsack problem

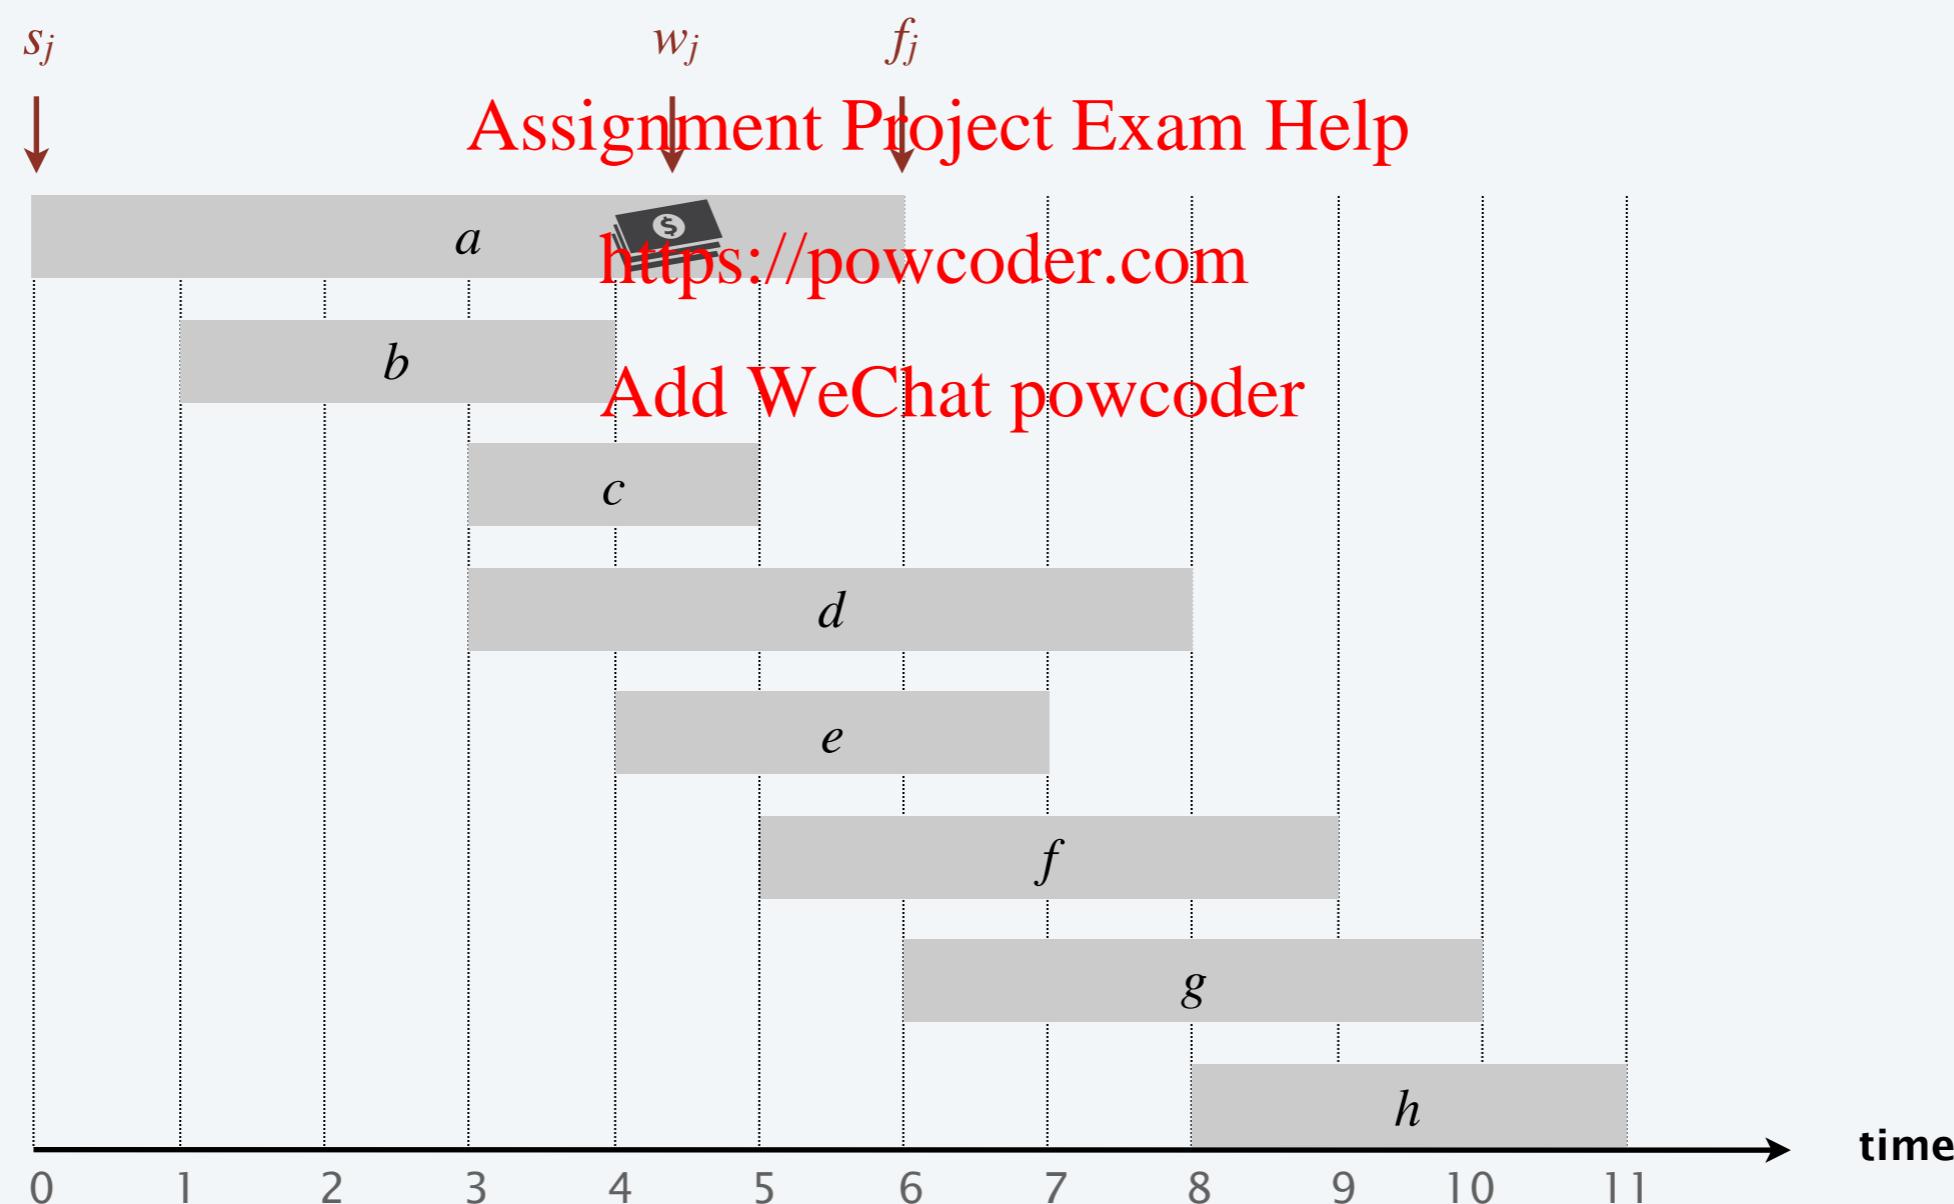

<https://powcoder.com>

▶ RNA secondary structure

Add WeChat powcoder

Weighted interval scheduling

- Job j starts at s_j , finishes at f_j , and has weight $w_j > 0$.
- Two jobs are **compatible** if they don't overlap.
- Goal: find max-weight subset of mutually compatible jobs.

Earliest-finish-time first algorithm

Earliest finish-time first.

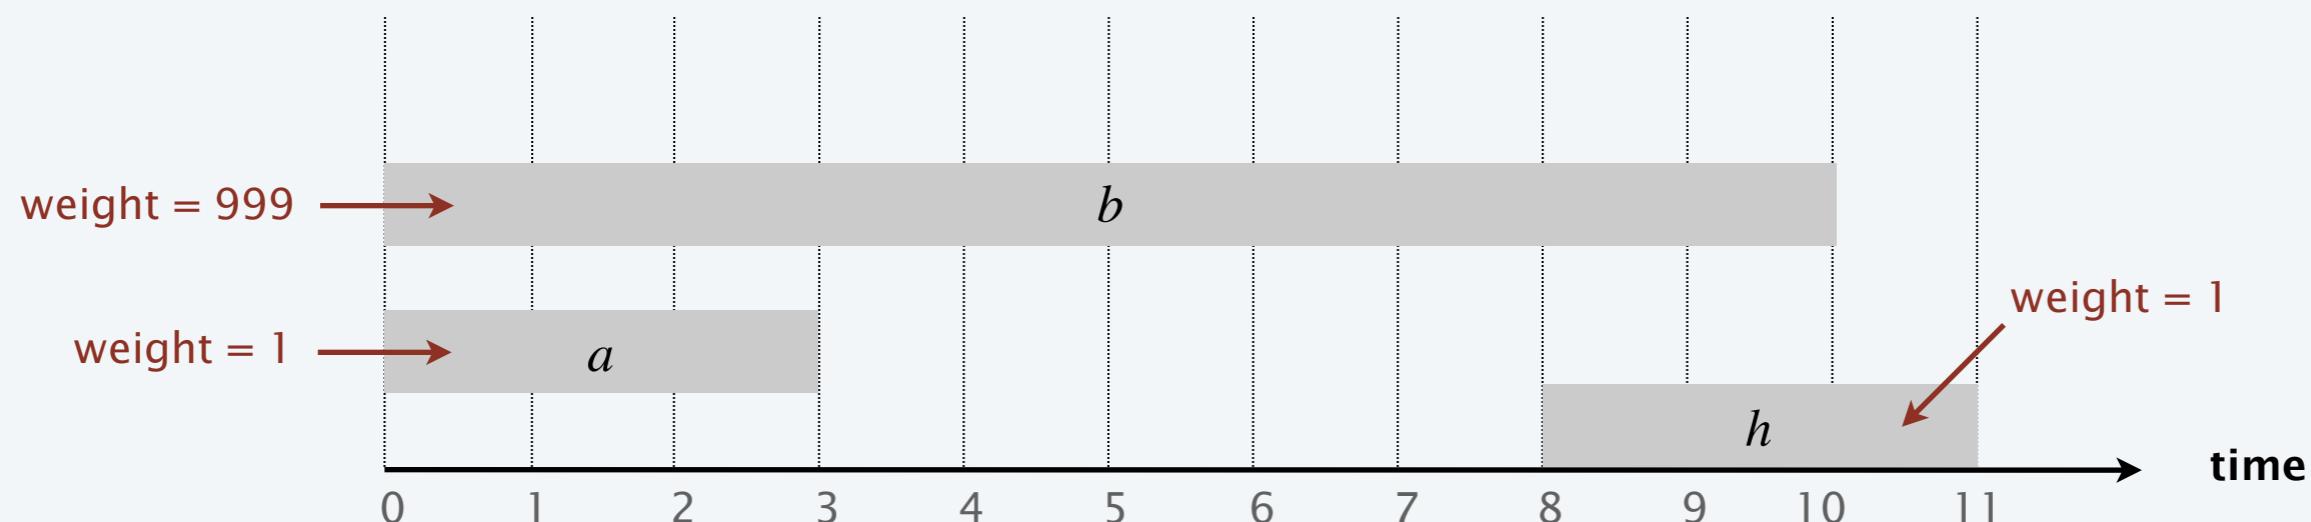

- Consider jobs in ascending order of finish time.
- Add job to subset if it is compatible with previously chosen jobs.

Recall. Greedy algorithm is correct if all weights are 1.

Assignment Project Exam Help

Observation. Greedy algorithm fails spectacularly for weighted version.

Add WeChat powcoder

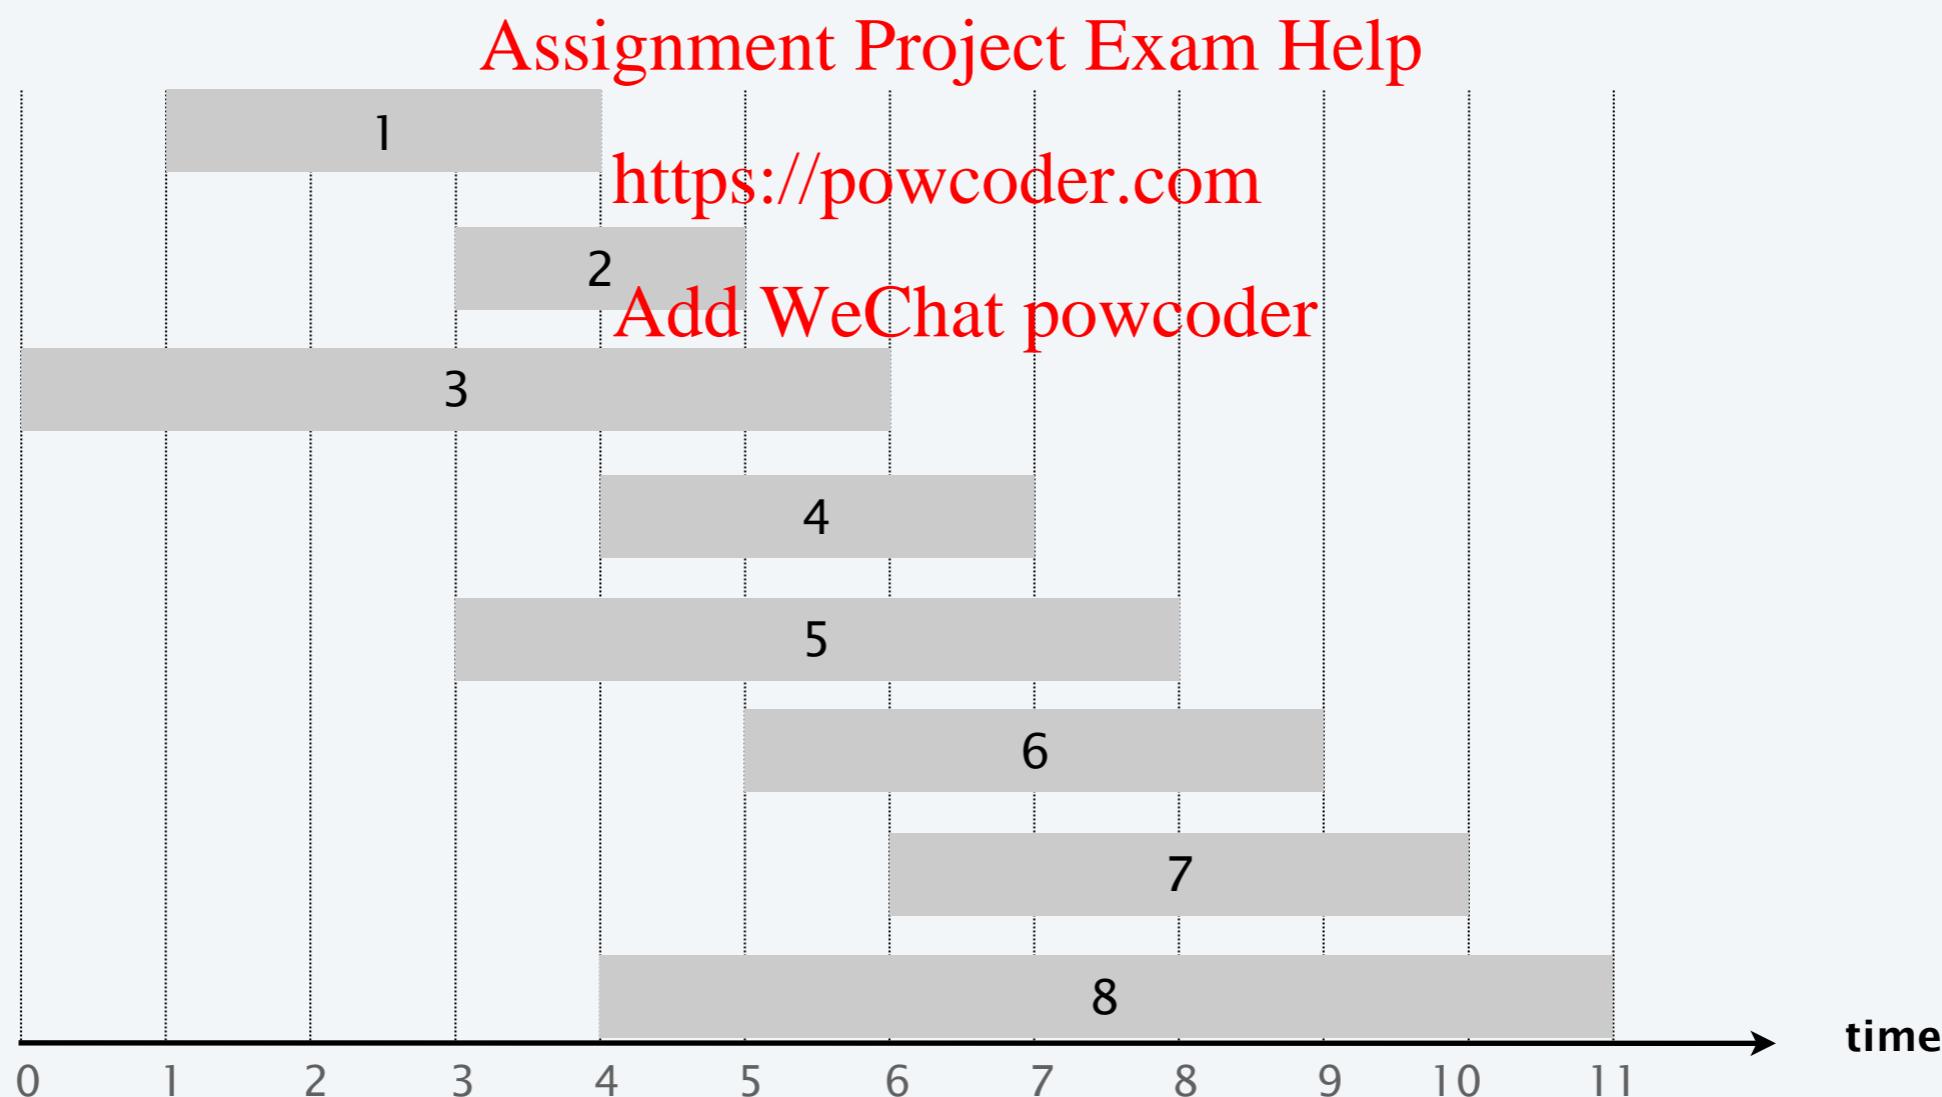

Weighted interval scheduling

Convention. Jobs are in ascending order of finish time: $f_1 \leq f_2 \leq \dots \leq f_n$.

Def. $p(j)$ = largest index $i < j$ such that job i is compatible with j .

Ex. $p(8) = 1, p(7) = 3, p(2) = 0$.

*i is leftmost interval
that ends before j begins*

Dynamic programming: binary choice

Def. $OPT(j)$ = max weight of any subset of mutually compatible jobs for subproblem consisting only of jobs $1, 2, \dots, j$.

Goal. $OPT(n)$ = max weight of any subset of mutually compatible jobs.

Case 1. $OPT(j)$ does not select job j .

Assignment Project Exam Help

- Must be an optimal solution to problem consisting of remaining jobs $1, 2, \dots, j - 1$.

Add WeChat powcoder

optimal substructure property
(proof via exchange argument)

Case 2. $OPT(j)$ selects job j .

- Collect profit w_j .
- Can't use incompatible jobs $\{ p(j) + 1, p(j) + 2, \dots, j - 1 \}$.
- Must include optimal solution to problem consisting of remaining compatible jobs $1, 2, \dots, p(j)$.

Bellman equation. $OPT(j) = \begin{cases} 0 & \text{if } j = 0 \\ \max \{ OPT(j - 1), w_j + OPT(p(j)) \} & \text{if } j > 0 \end{cases}$

Weighted interval scheduling: brute force

BRUTE-FORCE ($n, s_1, \dots, s_n, f_1, \dots, f_n, w_1, \dots, w_n$)

Sort jobs by finish time and renumber so that $f_1 \leq f_2 \leq \dots \leq f_n$.

Compute $p[1], p[2], \dots, p[n]$ via binary search.

Assignment Project Exam Help

RETURN COMPUTE-OPT(n).

<https://powcoder.com>

Add WeChat powcoder

COMPUTE-OPT(j)

IF ($j = 0$)

RETURN 0.

ELSE

RETURN max {COMPUTE-OPT($j - 1$), $w_j + \text{COMPUTE-OPT}(p[j])$ }.

What is running time of COMPUTE-OPT(n) in the worst case?

A. $\Theta(n \log n)$

B. $\Theta(n^2)$

C. $\Theta(1.618^n)$

Assignment Project Exam Help

D. $\Theta(2^n)$

<https://powcoder.com>

Add WeChat powcoder

COMPUTE-OPT(j)

IF ($j = 0$)

RETURN 0.

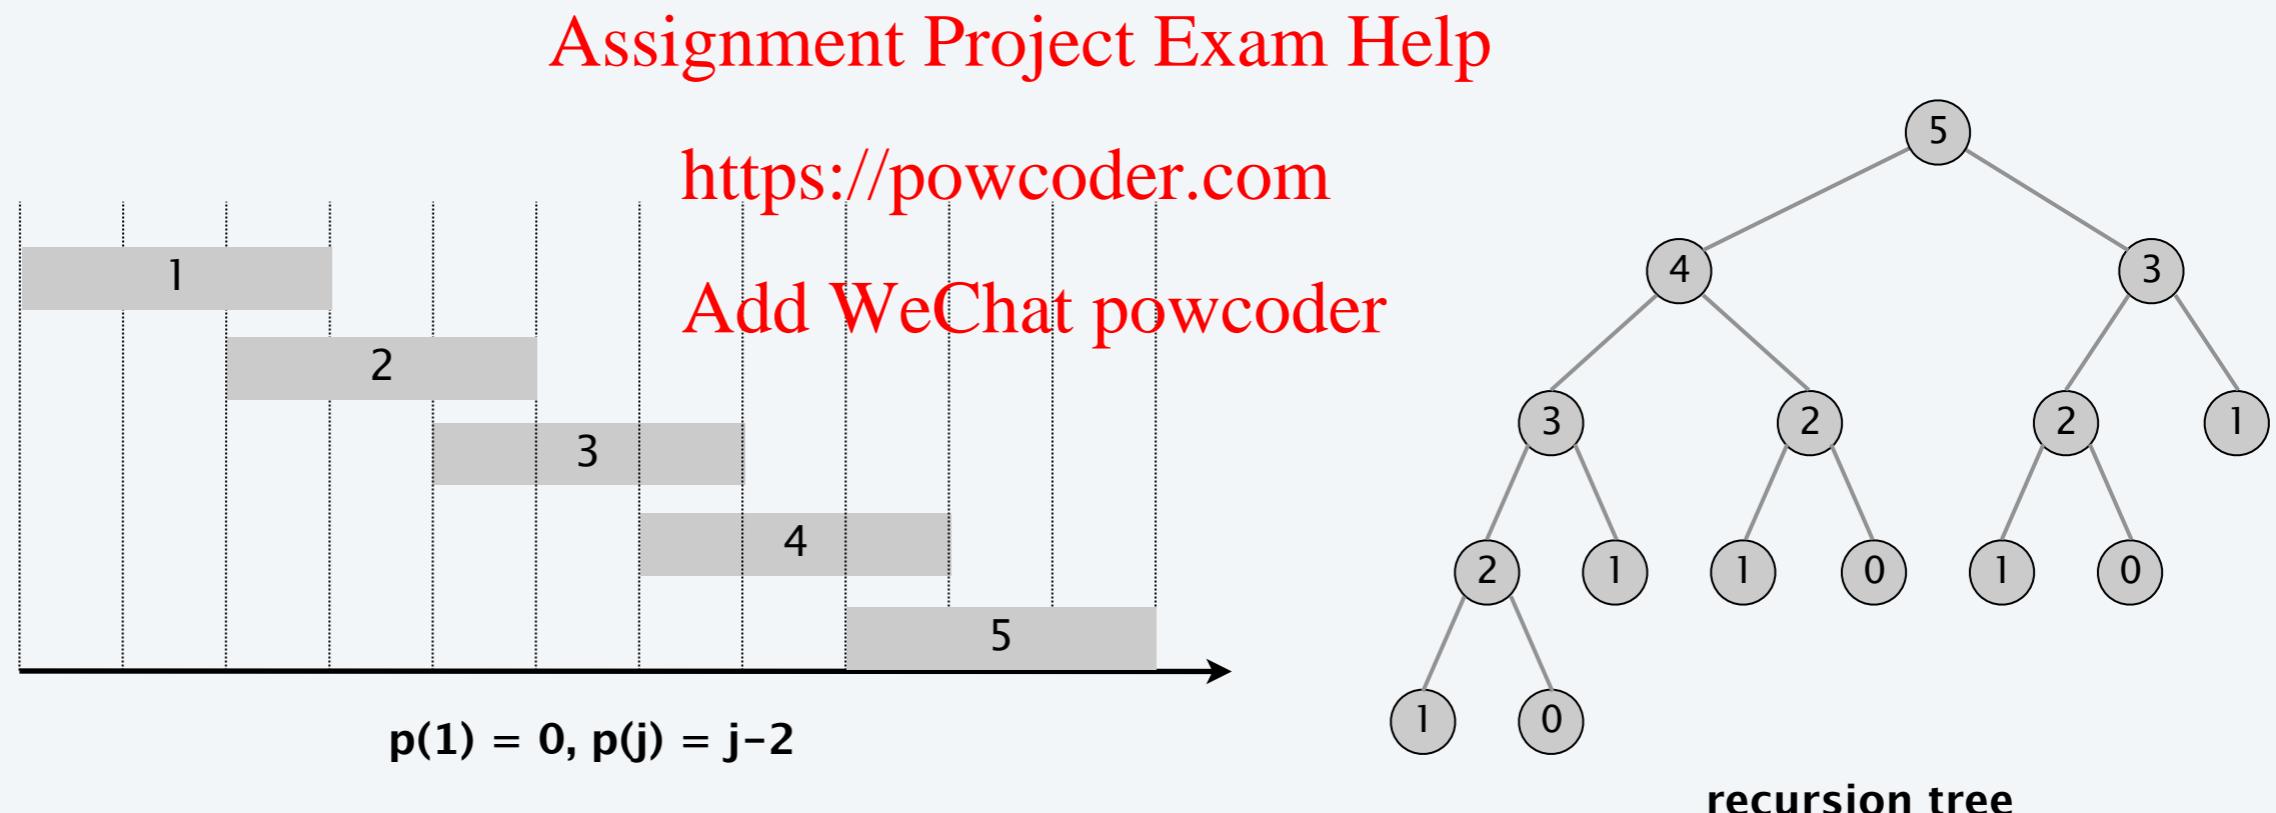

ELSE

RETURN max {COMPUTE-OPT($j - 1$), $w_j + \text{COMPUTE-OPT}(p[j])$ }.

Weighted interval scheduling: brute force

Observation. Recursive algorithm is spectacularly slow because of overlapping subproblems \Rightarrow exponential-time algorithm.

Ex. Number of recursive calls for family of “layered” instances grows like Fibonacci sequence.

Weighted interval scheduling: memoization

Top-down dynamic programming (memoization).

- Cache result of subproblem j in $M[j]$.
- Use $M[j]$ to avoid solving subproblem j more than once.

TOP-DOWN($n, s_1, \dots, s_n, f_1, \dots, f_n, w_1, \dots, w_n$)

Sort jobs by finish time and renumber so that $f_1 \leq f_2 \leq \dots \leq f_n$.
Assignment Project Exam Help

Compute $p[1], p[2], \dots, p[n]$ via binary search.
<https://powcoder.com>

$M[0] \leftarrow 0.$ ← global array
Add WeChat powcoder

RETURN M-COMPUTE-OPT(n).

M-COMPUTE-OPT(j)

IF ($M[j]$ is uninitialized)

$M[j] \leftarrow \max \{ \text{M-COMPUTE-OPT}(j-1), w_j + \text{M-COMPUTE-OPT}(p[j]) \}.$

RETURN $M[j]$.

Weighted interval scheduling: running time

Claim. Memoized version of algorithm takes $O(n \log n)$ time.

Pf.

- Sort by finish time: $O(n \log n)$ via mergesort.
- Compute $p[j]$ for each j : $O(n \log n)$ via binary search.
- M-COMPUTE-OPT(j): each invocation takes $O(1)$ time and either
 - (1) returns an initialized value $M[j]$
 - (2) initializes $M[j]$ and makes two recursive calls
<https://powcoder.com>
Add WeChat powcoder
- Progress measure $\Phi = \#$ initialized entries among $M[1..n]$.
 - initially $\Phi = 0$; throughout $\Phi \leq n$.
 - (2) increases Φ by 1 $\Rightarrow \leq 2n$ recursive calls.
- Overall running time of M-COMPUTE-OPT(n) is $O(n)$. ■

Those who cannot remember the
Assignment Project Exam Help
past are condemned to repeat it.
<https://powcoder.com>
Add WeChat powcoder
- Dynamic Programming

Weighted interval scheduling: finding a solution

Q. DP algorithm computes optimal value. How to find optimal solution?

A. Make a second pass by calling FIND-SOLUTION(n).

FIND-SOLUTION(j)

IF ($j = 0$)

Assignment Project Exam Help
RETURN \emptyset .

ELSE IF ($w_j + M[p[j]] > M[j-1]$)

RETURN Add WeChat powcoder[j].

ELSE

RETURN FIND-SOLUTION($j-1$).

$$M[j] = \max \{ M[j-1], w_j + M[p[j]] \}.$$

Analysis. # of recursive calls $\leq n \Rightarrow O(n)$.

Weighted interval scheduling: bottom-up dynamic programming

Bottom-up dynamic programming. Unwind recursion.

BOTTOM-UP($n, s_1, \dots, s_n, f_1, \dots, f_n, w_1, \dots, w_n$)

Sort jobs by finish time and renumber so that $f_1 \leq f_2 \leq \dots \leq f_n$.

Compute $p[1], p[2], \dots, p[n]$.
<https://powcoder.com>

$M[0] \leftarrow 0$.

FOR $j = 1$ TO n

Add WeChat powcoder
previously computed values

$M[j] \leftarrow \max \{ M[j-1], w_j + M[p[j]] \}$.

Running time. The bottom-up version takes $O(n \log n)$ time.

MAXIMUM SUBARRAY PROBLEM

Goal. Given an array x of n integer (positive or negative), find a contiguous subarray whose sum is maximum.

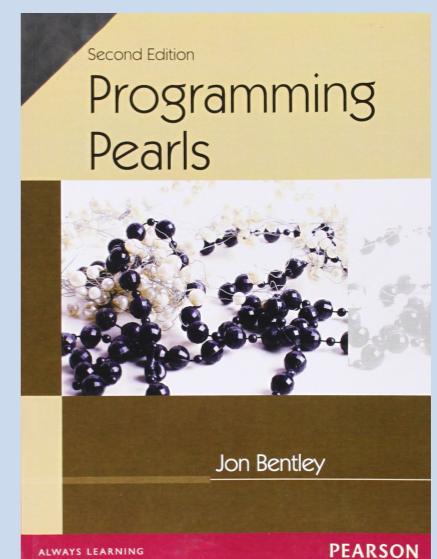

Assignment Project Exam Help
₁₈₇

<https://powcoder.com>

Add WeChat powcoder

Applications. Computer vision, data mining, genomic sequence analysis, technical job interviews,

MAXIMUM RECTANGLE PROBLEM

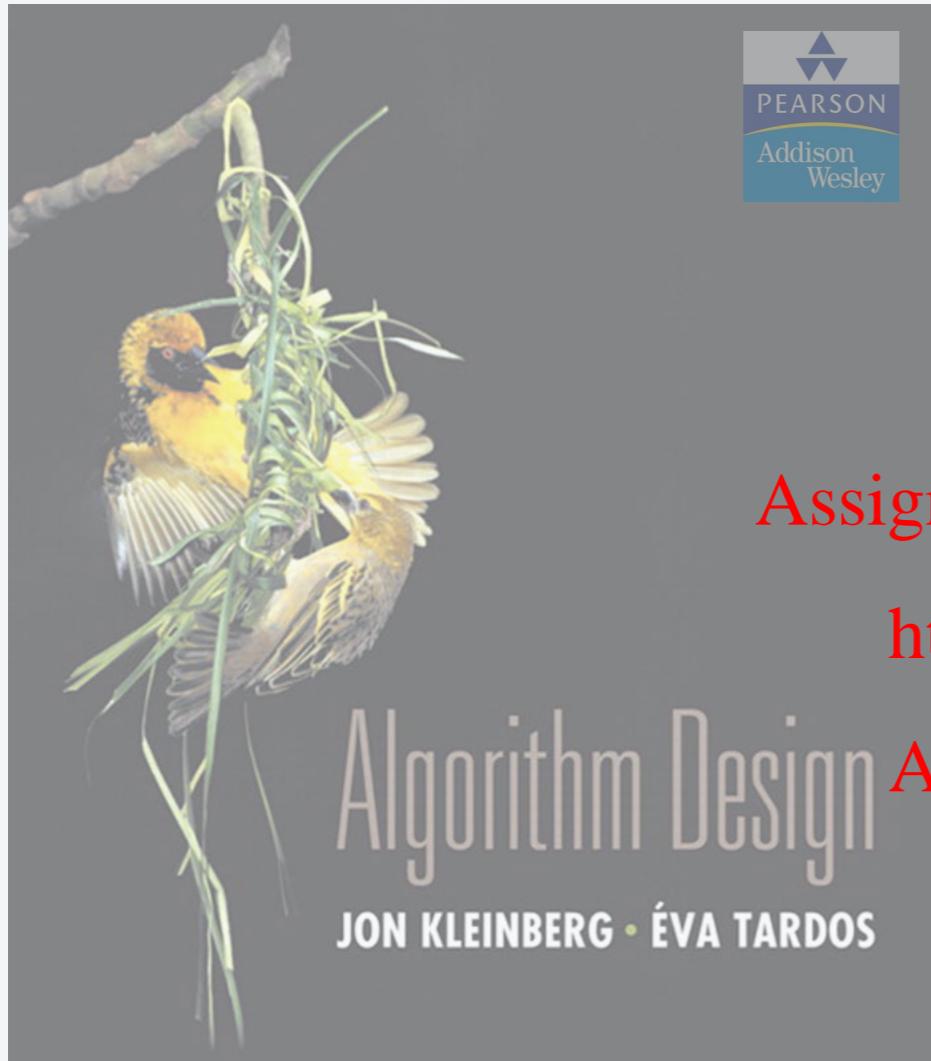

Goal. Given an n -by- n matrix A , find a rectangle whose sum is maximum.

$$A = \begin{bmatrix} -2 & 5 & 0 & -5 & -2 & 2 & -3 \\ 4 & -3 & -1 & 3 & 2 & 1 & -1 \\ -5 & 6 & 3 & -5 & -1 & -4 & -2 \\ -1 & \text{Assignment Project Exam Help} \\ -1 & \text{https://powcoder.com} \\ 3 & \text{Add WeChat powcoder} \\ -2 & 1 & -2 & 1 & 1 & 3 & -1 \\ 2 & -4 & 0 & 1 & 0 & -3 & -1 \end{bmatrix}$$

13

Applications. Databases, image processing, maximum likelihood estimation, technical job interviews, ...

- ▶ *weighted interval scheduling*
- ▶ *segmented least squares*

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Least squares

Least squares. Foundational problem in statistics.

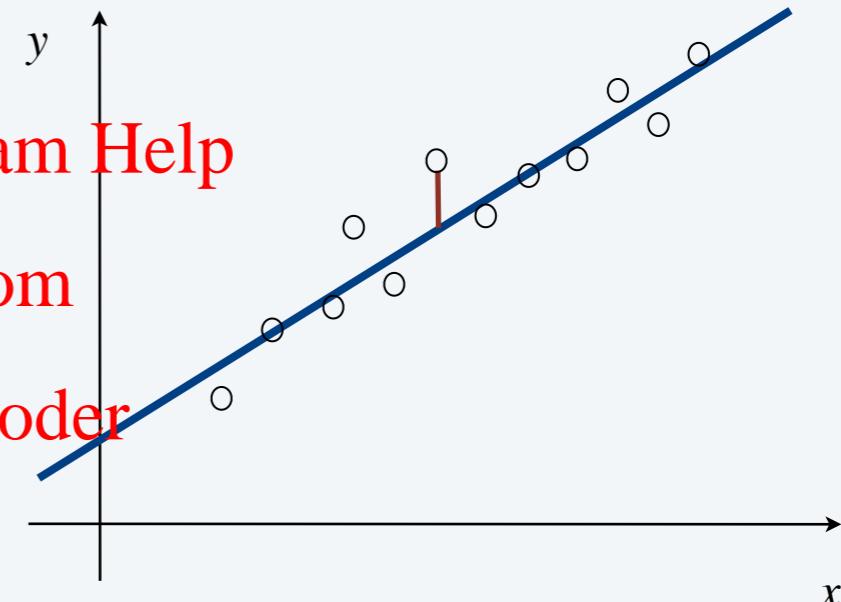

- Given n points in the plane: $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$.
- Find a line $y = ax + b$ that minimizes the sum of the squared error:

$$SSE = \sum_{i=1}^n (y_i - ax_i - b)^2$$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Solution. Calculus \Rightarrow min error is achieved when

$$a = \frac{n \sum_i x_i y_i - (\sum_i x_i)(\sum_i y_i)}{n \sum_i x_i^2 - (\sum_i x_i)^2}, \quad b = \frac{\sum_i y_i - a \sum_i x_i}{n}$$

Segmented least squares

Segmented least squares.

- Points lie roughly on a sequence of several line segments.
- Given n points in the plane: $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$ with $x_1 < x_2 < \dots < x_n$, find a sequence of lines that minimizes $f(x)$.

Q. What is a reasonable choice for $f(x)$ to balance accuracy and parsimony?

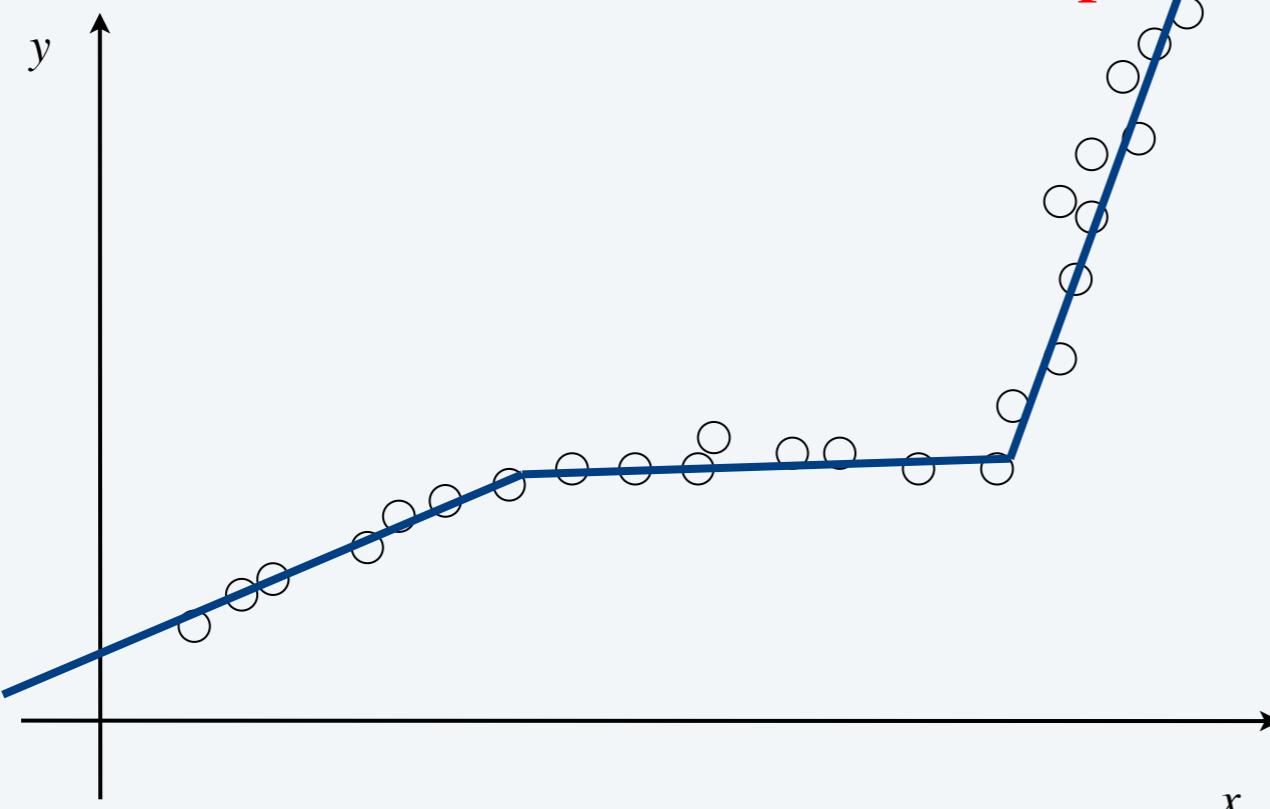

Assignment Project Exam Help

<https://powcoder.com>

goodness of fit

number of lines

Add WeChat powcoder

Segmented least squares

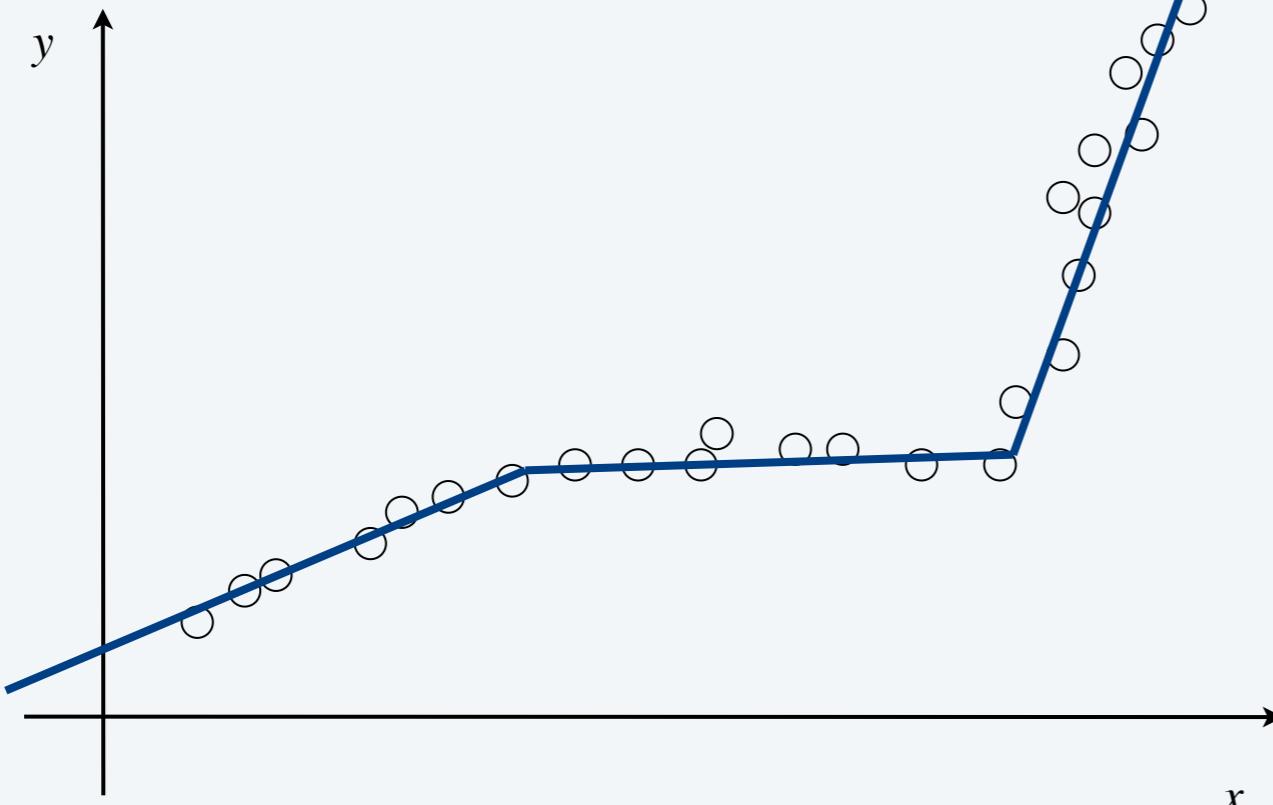

Segmented least squares.

- Points lie roughly on a sequence of several line segments.
- Given n points in the plane: $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$ with $x_1 < x_2 < \dots < x_n$, find a sequence of lines that minimizes $f(x)$.

Goal. Minimize $f(x) = E + cL$ for some constant $c > 0$, where

- E = sum of the sums of the squared errors in each segment.
- L = number of lines.

Add WeChat powcoder

Dynamic programming: multiway choice

Notation.

- $OPT(j)$ = minimum cost for points p_1, p_2, \dots, p_j .
- e_{ij} = SSE for points p_i, p_{i+1}, \dots, p_j .

To compute $OPT(j)$:

- Last segment uses points p_i, p_{i+1}, \dots, p_j for some $i \leq j$.
Assignment Project Exam Help
- Cost = $e_{ij} + c + OPT(i - 1)$. \leftarrow optimal substructure property
(Optimal via exchange argument)

Add WeChat powcoder

Bellman equation.

$$OPT(j) = \begin{cases} 0 & \text{if } j = 0 \\ \min_{1 \leq i \leq j} \{ e_{ij} + c + OPT(i - 1) \} & \text{if } j > 0 \end{cases}$$

previously computed value

FOR $j = 1$ TO n

$M[j] \leftarrow \min_{1 \leq i \leq j} \{ e_{ij} + c + M[i-1] \}.$

RETURN $M[n]$.

Segmented least squares analysis

Theorem. [Bellman 1961] DP algorithm solves the segmented least squares problem in $O(n^3)$ time and $O(n^2)$ space.

Pf.

- Bottleneck = computing SSE e_{ij} for each i and j .

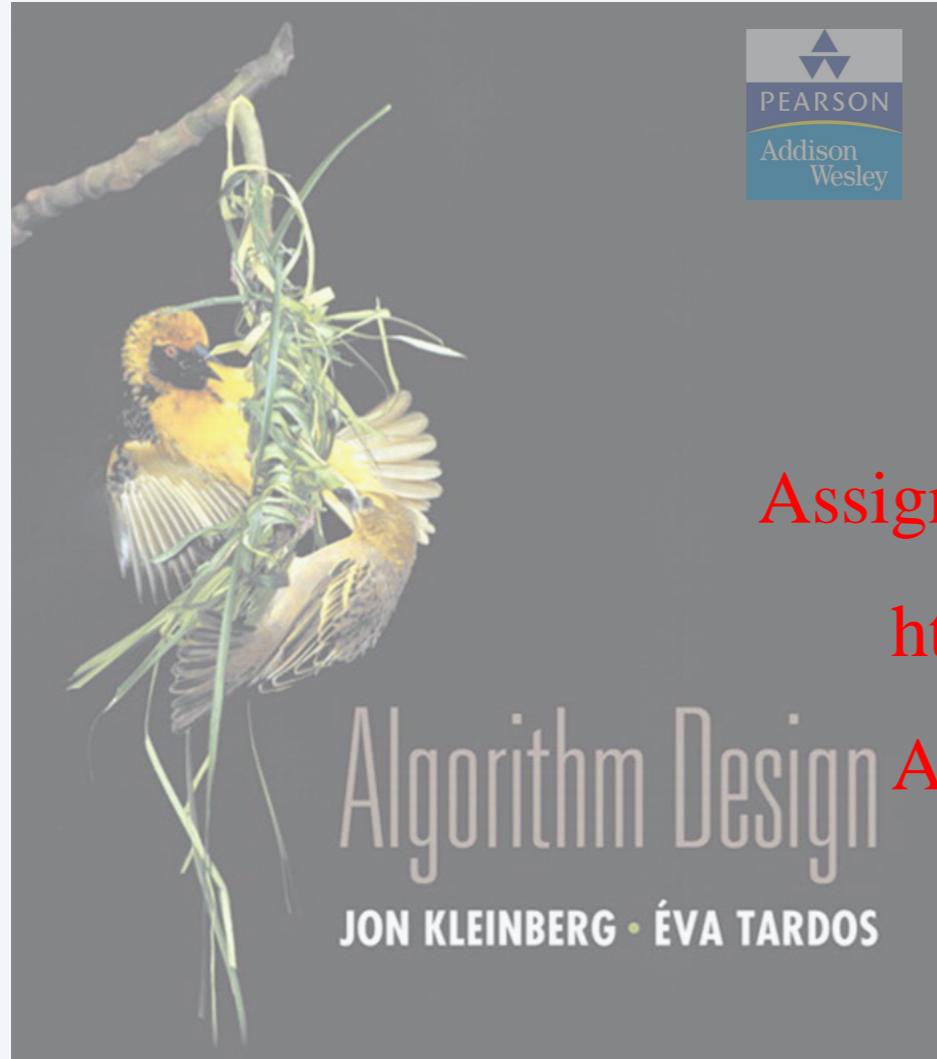

$$a_{ij} = \frac{n \sum_k x_k y_k - (\sum_k x_k)(\sum_k y_k)}{n \sum_k x_k^2 - (\sum_k x_k)^2}, \quad b_{ij} = \frac{\sum_k y_k - a_{ij} \sum_k x_k}{n}$$

Add WeChat powcoder

- $O(n)$ to compute e_{ij} . ■

Remark. Can be improved to $O(n^2)$ time.

- For each i : precompute cumulative sums $\sum_{k=1}^i x_k, \sum_{k=1}^i y_k, \sum_{k=1}^i x_k^2, \sum_{k=1}^i x_k y_k$.
- Using cumulative sums, can compute e_{ij} in $O(1)$ time.

6. DYNAMIC PROGRAMMING I

- ▶ *weighted interval scheduling*
- ▶ *segmented least squares*
- ▶ **Assignment Project Exam Help**
- ▶ **knapsack problem**

<https://powcoder.com>

Add WeChat powcoder

SECTION 6.4

Knapsack problem

Goal. Pack knapsack so as to maximize total value of items taken.

- There are n items: item i provides value $v_i > 0$ and weighs $w_i > 0$.
- Value of a subset of items = sum of values of individual items.
- Knapsack has weight limit of W .

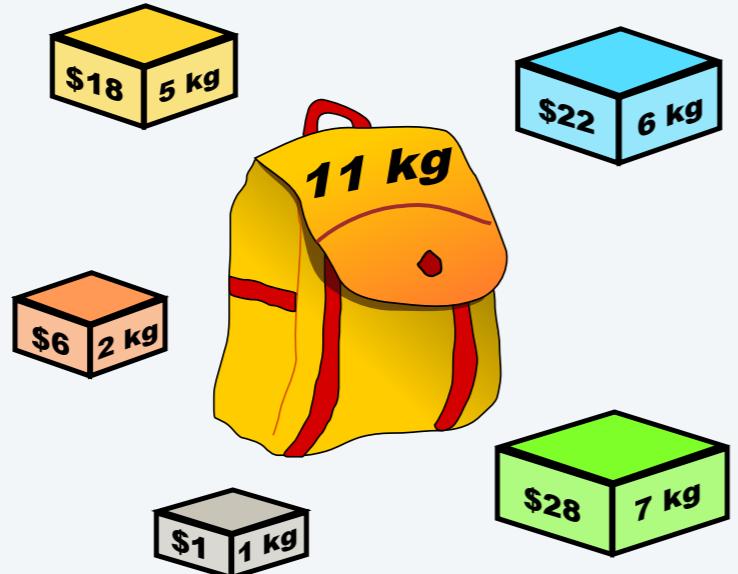

Ex. The subset { 1, 2, 5 } has value \$35 (and weight 10).

Assignment Project Exam Help

Ex. The subset { 3, 4 } has value \$40 (and weight 11).

<https://powcoder.com>

Assumption. All values and weights are integers.

i	v_i	w_i
1	\$1	1 kg
2	\$6	2 kg
3	\$18	5 kg
4	\$22	6 kg
5	\$28	7 kg

weights and values
can be arbitrary
positive integers

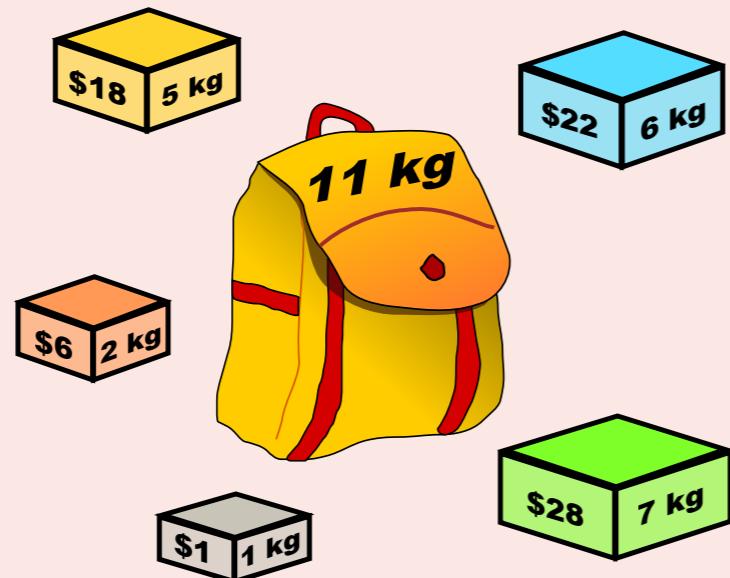

knapsack instance
(weight limit $W = 11$)

Which algorithm solves knapsack problem?

- A. Greedy-by-value: repeatedly add item with maximum v_i .
- B. Greedy-by-weight: repeatedly add item with minimum w_i .
- C. Greedy-by-ratio; repeatedly add item with maximum ratio v_i / w_i .

Assignment Project Exam Help
weight limit w

$OPT(i, w)$ = optimal value of knapsack problem with items 1, ..., i, subject to weight limit w

Knapsack problem: running time

Theorem. The DP algorithm solves the knapsack problem with n items and maximum weight W in $\Theta(n W)$ time and $\Theta(n W)$ space.

Pf.

- Takes $O(1)$ time per table entry.
- There are $\Theta(n W)$ table entries.
- After computing optimal values, can trace back to find solution:
 $OPT(i, w)$ takes item i iff $M[i, w] > M[i - 1, w]$. ▀

weights are integers
between 1 and W

<https://powcoder.com>

Add WeChat powcoder

Remarks.

- Algorithm depends critically on assumption that weights are integral.
- Assumption that values are integral was not used.

Does there exist a poly-time algorithm for the knapsack problem?

- A. Yes, because the DP algorithm takes $\Theta(n W)$ time.
- B. No, because $\Theta(n W)$ is not a polynomial function of the input size.
- C. No, because the problem is NP-hard.
- D. Unknown.

<https://powcoder.com>

Add WeChat powcoder

COIN CHANGING

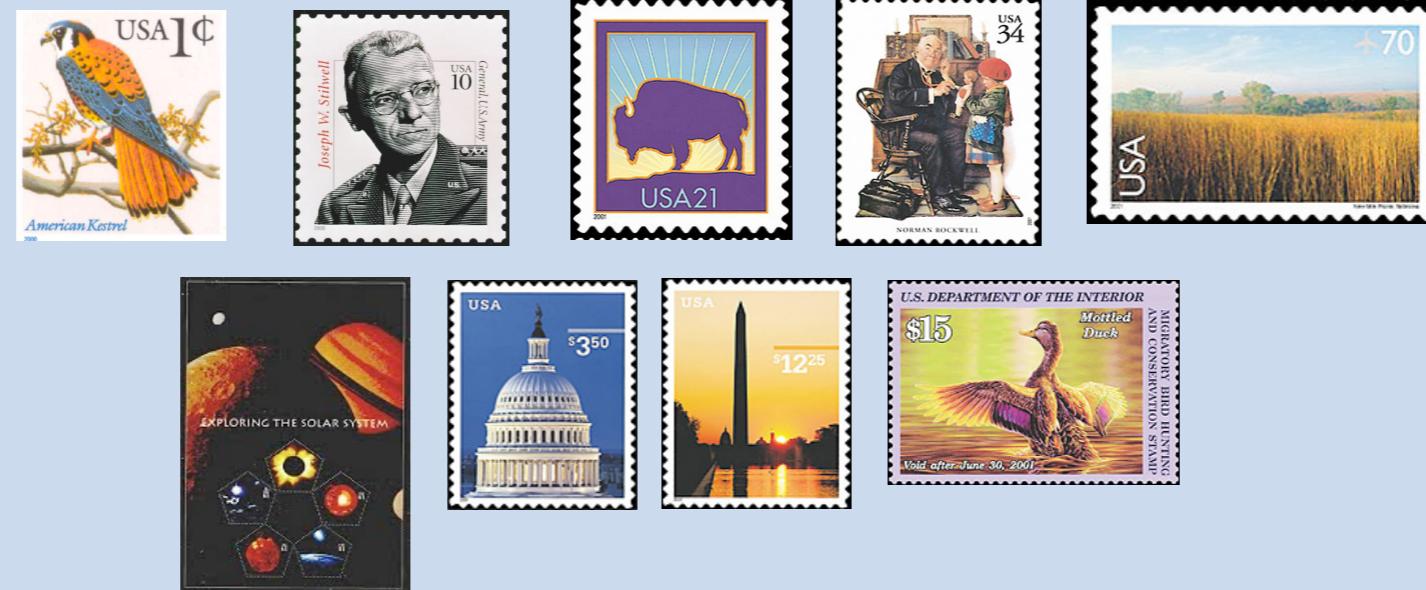

Problem. Given n coin denominations $\{ c_1, c_2, \dots, c_n \}$ and a target value V , find the fewest coins needed to make change for V (or report impossible).

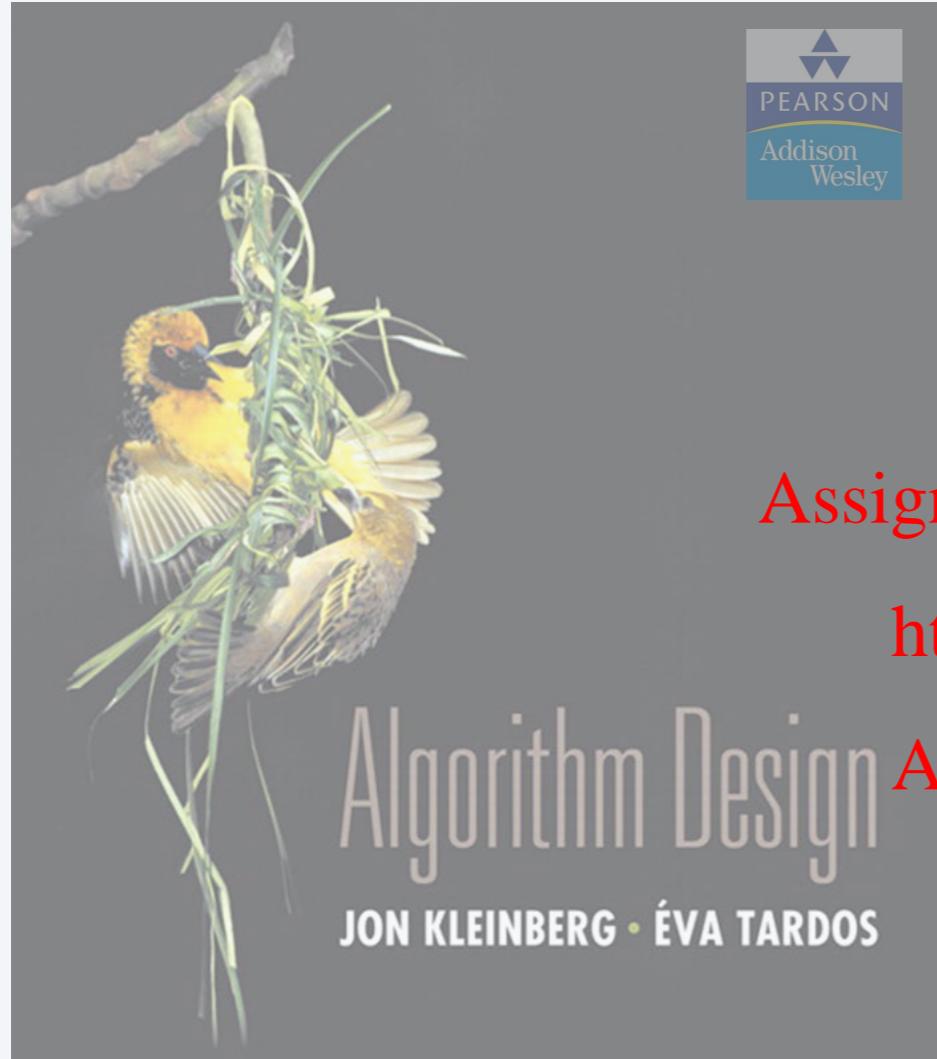

Recall. Greedy cashier's algorithm is optimal for U.S. coin denominations, but not for arbitrary coin denominations.

[Assignment Project Exam Help](https://powcoder.com)

Ex. $\{ 1, 10, 21, 34, 70, 100, 350, 1295, 1500 \}$.

Optimal. $140\text{¢} = 70 + 70$. [Add WeChat powcoder](#)

Add WeChat powcoder

Free-energy hypothesis. RNA molecule will form the secondary structure with the minimum total free energy.

↑
approximate by number of base pairs
(more base pairs \Rightarrow lower free energy)

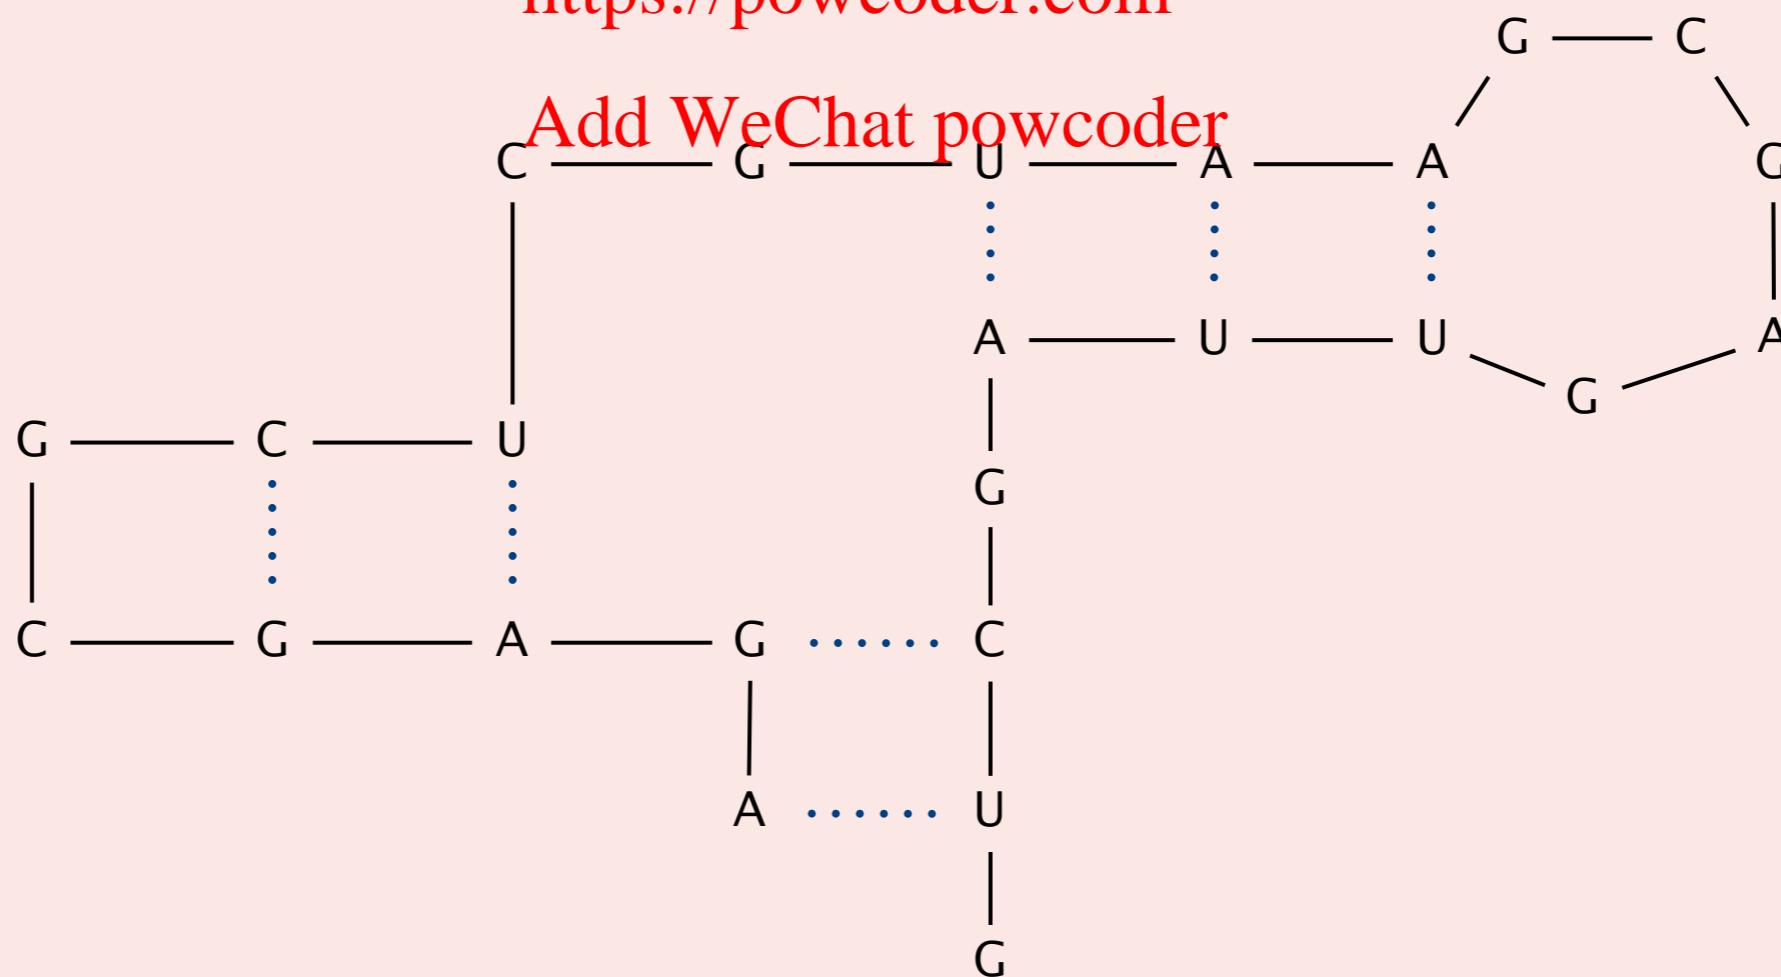

Goal. Given an RNA molecule $B = b_1 b_2 \dots b_n$, find a secondary structure S that maximizes the number of base pairs.

Is the following a secondary structure?

- A. Yes.
- B. No, violates Watson-Crick condition.
- C. No, violates no-sharp-turns condition.
- D. No, violates no-crossing condition.

<https://powcoder.com>

Which subproblems?

- A. $OPT(j) = \max$ number of base pairs in secondary structure of the substring $b_1 b_2 \dots b_j$.
- B. $OPT(j) = \max$ number of base pairs in secondary structure of the substring $b_j b_{j+1} \dots b_n$.
- C. Either A or B.
- D. Neither A nor B.

Assignment Project Exam Help

<https://powcoder.com>

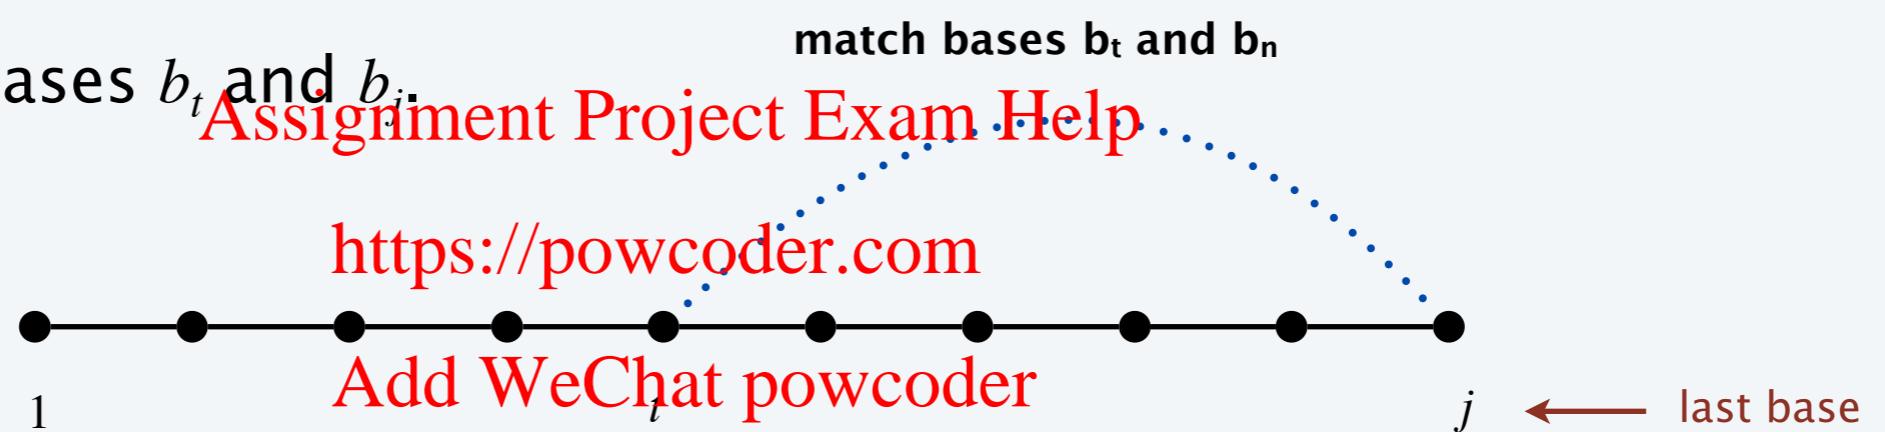

Add WeChat powcoder

RNA secondary structure: subproblems

First attempt. $OPT(j)$ = maximum number of base pairs in a secondary structure of the substring $b_1 b_2 \dots b_j$.

Goal. $OPT(n)$.

Choice. Match bases b_t and b_i .

Difficulty. Results in two subproblems (but one of wrong form).

- Find secondary structure in $b_1 b_2 \dots b_{t-1}$. $\leftarrow OPT(t-1)$
- Find secondary structure in $b_{t+1} b_{t+2} \dots b_{j-1}$. \leftarrow need more subproblems
(first base no longer b_1)

Dynamic programming over intervals

Def. $OPT(i, j)$ = maximum number of base pairs in a secondary structure of the substring $b_i b_{i+1} \dots b_j$.

Case 1. If $i \geq j - 4$.

- $OPT(i, j) = 0$ by no-sharp-turns condition.

Assignment Project Exam Help

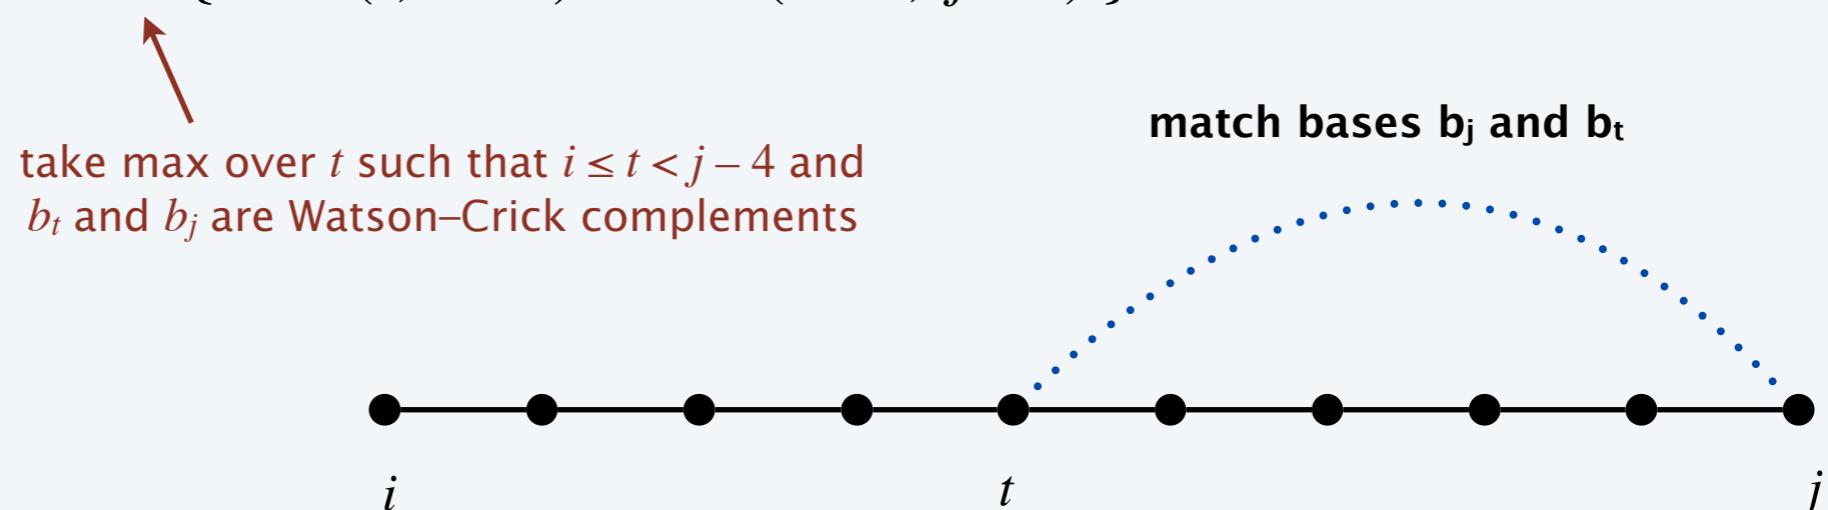

Case 2. Base b_j is not involved in a pair.

- $OPT(i, j) = OPT(i, j - 1)$. <https://powcoder.com>

Add WeChat powcoder

Case 3. Base b_j pairs with b_t for some $i \leq t < j - 4$.

- Non-crossing condition decouples resulting two subproblems.
- $OPT(i, j) = 1 + \max_t \{ OPT(i, t - 1) + OPT(t + 1, j - 1) \}$.

In which order to compute $OPT(i, j)$?

- A. Increasing i , then j .
- B. Increasing j , then i .

C. Either A or B.

Assignment Project Exam Help

- D. Neither A nor B.

Bottom-up dynamic programming over intervals

Q. In which order to solve the subproblems?

A. Do shortest intervals first—increasing order of $|j - i|$.

RNA-SECONDARY-STRUCTURE(n, b_1, \dots, b_n)

FOR $k = 5$ TO $n - 1$

 FOR $i = 1$ TO $n - k$

$j \leftarrow i + k$.

 Compute $M[i, j]$ using formula.

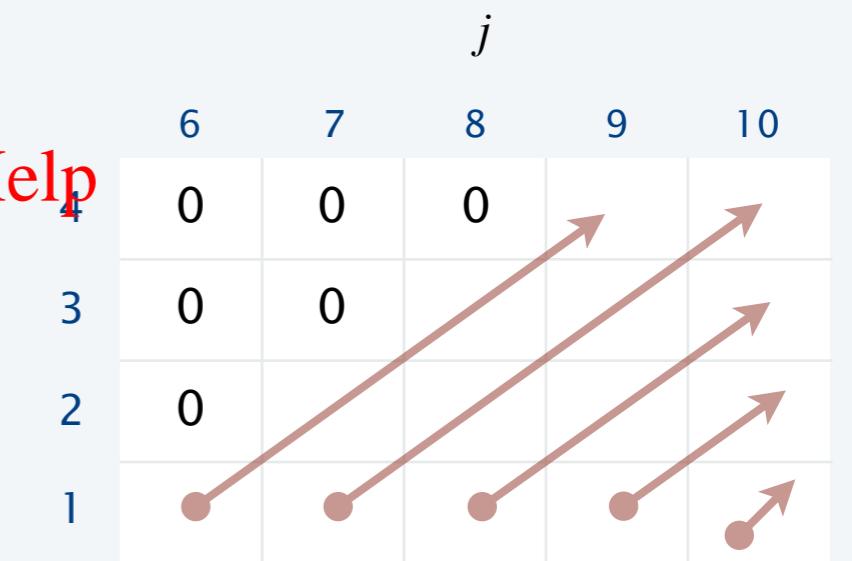

RETURN $M[1, n]$.

order in which to solve subproblems

Theorem. The DP algorithm solves the RNA secondary structure problem in $O(n^3)$ time and $O(n^2)$ space.

Dynamic programming summary

Outline.

- Define a collection of subproblems.
- Solution to original problem can be computed from subproblems.
- Natural ordering of subproblems from “smallest” to “largest” that enables determining a solution to a subproblem from solutions to smaller subproblems.

typically, only a polynomial number of subproblems

Techniques.

<https://powcoder.com>

- Binary choice: weighted ~~Add We Chat powcoder~~ interval scheduling
- Multiway choice: segmented least squares.
- Adding a new variable: knapsack problem.
- Intervals: RNA secondary structure.

Top-down vs. bottom-up dynamic programming. Opinions differ.
